EXECUTIVE SUMMARY

The Hospital Emergency Department Profile Annual Report 1 (ED-AR1) is a standard report containing emergency department (ED) information released by the Bureau of Emergency Medical Services (BEMS), Utah Department of Health. The 1996 ED-AR1 is the first report of statewide hospital ED encounter aggregate data in Utah, excluding those encounters that have resulted in inpatient hospital stays. This report, containing hospital-level all payer data, will serve as the basis for smaller reports on specific topics. The ED data will be used to support evaluation and monitoring of annual ED utilization trends.

During 1996, there was a total of 502,818 encounters to Utah hospital EDs, about 25.1 encounters per 100 persons, which was lower than the national ED encounter rate of 34.2 percent (National Hospital Ambulatory Medical Care Survey, 1996). The total charge for the 502,818 ED encounters was reported at \$568,634,097 (Table 1). Of the total encounters, 453,331 (or 90.2 percent) visits were made to EDs, with no subsequent admission to facilities (throughout referred to as ED-visit), with a reported total charge of \$126,142,688. The remaining 49,487 encounters (or 9.8 percent) have resulted in inpatient stays in the facilities (ED-inpatient) with a total cost of \$442,491,409 (Table 1).

Similar to national rates, Utah women comprised a slightly higher proportion of overall visits as compared with their male counterparts; 50.6 percent vs. 49.4 percent (Table 5). More than forty percent of total ED visits during 1996 were by Utahns aged 24 and under. Another forty percent were by adults aged between 25 and 54. Consistent with national trends, Utahns 75 years and over had the lowest percentage ED visits; 5.1 percent and 8.2 percent nationally (NHAMCS, 1996).

Analysis of the 1996 Utah ED-visit data (Table 1) showed that number of visits to urban hospitals was more than three times higher than the number of visits to rural ones; 346,798 (or 76.5 percent of the total visits) and 106,533 (or 23.5 percent of the total visits) respectively. Also, the reported total charge associated with visits to urban hospitals (\$98,886,335) was four times higher as the reported total charge associated with visits to rural hospitals (\$27,256,353). Injury and poisoning have accounted for more than 40 percent of Utah's ED visits (Table 2). This rate is higher than the national ED figure of 31.6 percent (NHAMCS, 1996). The total charge associated with injury and poisoning in Utah was reported at \$49,522,095, or 39.3 percent of all charges. Many of these visits to Utah's EDs might have been prevented. For example, there were 172,171 visits related to unintentional injuries with a reported total cost of \$45,522,507, or 91.9 percent of the total cost of all injury and poisoning charges (Table 3). Of the 172,171 unintentional injuries reported, 44,048 or 25.6 percent were related to falls with a reported total charge of \$11,848,912. Also, 21,739 visits, or 12.6 percent of all unintentional injuries, were related to motor vehicle traffic crashes with a reported total charge of \$7,173,870 (Table 7). Visits for non-life-threatening and common illnesses, such as 11,094 ear infections and 16,086 sore throats with the reported total charges of \$1,025,428 and \$2,559,545 (Table 4), might have been better treated in a clinic or doctor's office at a much lower cost.

Public insurance (Medicare, Medicaid, and other government sources) was the primary source of payment for more than 23 percent of ED visits (Table 5). Within public insurance agencies, Medicaid and Medicare, with 10.6 and 9.6 percent, had almost an equal share as primary payers followed by other government sources (3.2 percent). Managed care organizations with 19.5 percent were reported as the number one source of primary payment. Next to public insurance agencies and managed care organizations as primary payers were self pay (7.6 percent), Blue Cross Blue Shield (7.2 percent), and industrial (5.8 percent).

The Hospital Emergency Department Profile Annual Report 1 (ED-AR1) is a standard report containing emergency department information released by the Bureau of Emergency Medical Services, Utah Department of Health. This report, containing hospital-level all-payer data, will serve as the basis for smaller reports on specific topics. The emergency department data will be used to support evaluation and monitoring of annual ED utilization trends.

ABOUT THE DATA

State Emergency Medical Services Committee

The Utah Emergency Medical Services Systems Act, 26-8, Utah Code Annotated, authorizes the Bureau of Emergency Medical Services (BEMS) to establish an emergency medical services data system. The data elements are defined by the State Emergency Medical Services Committee (the Committee), relating to the treatment and care of patients, who use or have used, the emergency medical services system (26-8-4(11) and 26-8-5(5)). In addition, 26-8-7(4) states the following:

"Persons (defined as "any individual, firm, partnership, association, corporation, company, group of individuals acting together for a common purpose, agency or organization of any kind, public or private") providing emergency medical services shall provide to the department information for the emergency medical services information system established pursuant to Subsection 26-8-5(5)."

The Emergency Department Patient Encounter Data Base

Administrative Rule R426-1-7(I), mandates that all Utah licensed hospitals report information on ED patient encounters. The rule defines the data elements which hospitals are required to submit to BEMS under statute and administrative rules specifically for the purpose of constructing a statewide Emergency Department Patient Data (EDPD) base.

Data Submission

Patient data records are to be submitted to the Bureau as specified in the submittal manual. The data elements to be submitted are based on the encounter occurring in a calendar quarter.

System Edits

Data are validated through a process of automated editing and report verification. Each record is subjected to a series of edits that check for accuracy, consistency, completeness, and conformity with the definitions specified in the submittal manual. Records failing the edit check are returned to the data supplier for correction and/or comment.

Privacy, Confidentiality, and Access

Privacy

The individual's right to privacy refers to a patient's capacity to control identifiable information about him/herself that could be disclosed under certain conditions. Ensuring patient privacy is carefully considered in the management of EMS data files.

Public disclosure of individual hospital data is to be carefully guarded by use of calculated or aggregated values. Release of a hospital's identifiable data may occur if the hospital is allowed time to verify the accuracy of the information, to submit corrections with supporting evidence, to submit comments or alternate interpretations to the release; and that BEMS has corrected any data records found in error.

Confidentiality

Care will be taken to ensure that access to the BEMS raw data files is by authorized personnel only. All of the BEMS data files are managed in compliance with protective policies and procedures by BEMS and the Utah Department of Health. All personnel having any access to the BEMS data files are required to sign a "Confidentiality Pledge," which outlines their responsibilities and notifies them of the possible penalties for breach of the agreement.

Access

It is the policy of BEMS to support legitimate access to its ED data while protecting the patient and hospital right of privacy. This policy governs the administration of confidential data in the custody of BEMS. Aggregated values are released in designated EMS Resource Documents or User Friendly Reports.

This report describes ambulatory care encounter to hospital Emergency Departments (ED) and excludes those encounters which resulted in inpatient hospital stays. Encounters with hospital EDs represent a significant segment of ambulatory medical care. Consumers, employers, payers, policy-makers, and providers may begin to use this type of data to better understand the health needs of Utahns, including patterns of ED utilization and the burden of injuries and illness throughout the state.

ABOUT THIS REPORT

This report describes ambulatory care encounters to hospital EDs in Utah. The data presented in this report were collected from all licensed hospitals in Utah and represents all payers and uninsured encounters in Utah's EDs. The data were compiled, edited, and analyzed according to the methodology which is documented in this report.

Results

During 1996, there was a total of 502,818 encounters to Utah hospital EDs, about 25.1 encounters per 100 persons that was lower than the national ED encounter rate of 34.2 percent (National Hospital Ambulatory Medical Care Survey, 1996). The total charge for the 502,818 ED encounters was reported at \$568,634,097 (see Table 1). Of the total encounters, 453,331 (or 90.2) percent) visits made to EDs, with no subsequent admission to facilities, with a reported total charge of \$126,142,688. The remaining 49,487 encounters (or 9.2 percent) have resulted in inpatient stays in the facilities with a total cost of \$442,491,409. The present report, Emergency Department Annual Report 1 (ED-AR1), presents data on ED-visits, excluding those who have been admitted to facilities through ED. The next report, ED-AR2, presents data on patients who have been subsequently admitted to facilities as inpatients.

Patient characteristics

ED visits by patient's gender and age are displayed in Table 5. Similar to national rates, Utah women comprised a slightly higher proportion of overall visits as compared with their male counterparts (50.6 percent vs. 49.4 percent). More than forty percent of total ED visits during 1996 were by

Utahns aged 24 and under. Another forty percent were by adults aged 25 to 54. Consistent with national trends, Utahns 75 years and over comprised the lowest percentage of ED visits, 5.1 percent for Utah and 8.2 percent nationally (NHAMCS, 1996).

Visit characteristics

Geographic regions – Table 1 presents data on ED encounters by hospitals' geographic region. As expected, the number of visits to urban hospitals was more than three times higher as the number of visits to rural ones; 346,798 (or 76.5 percent of the total visits) and 106,533 (or 23.5 percent of the total visits) respectively. Also, the reported total charge associated with visits to urban hospitals (\$98,886,335) was more than three times higher as the reported total charge associated with visits to rural hospitals (\$27,256,353).

Major disease categories – As displayed in Table 6, More than 40 percent of all Utah's EDvisits were attributed to injury and poisoning, about 9.5 visits per 100 persons which was higher than the national rate of 13.2 visits per 100 persons (NHAMCS, 1996). The total charge associated with injury and poisoning was reported at \$49,522,095, or 39 percent of all ED-visits charges. Next to injury and poisoning were diseases of the respiratory system that accounted for only 9 percent of all ED visits with a reported total charge of \$8,938,016, or 7 percent of all ED- visits charges. The number of visits to EDs due to diseases of the circulatory system (8,145) were almost one fifth of the number of visits due to diseases of the

respiratory system (40,936). However, the average cost associated with treating diseases of the circulatory system were three times higher than the average cost associated with treating diseases of the respiratory system(\$684 and \$198 respectively).

Injury and poisoning related visits –Table 7 presents ED visits by the intent and mechanism of and type of injury for the first-listed external cause of injury. There were 172,171 visits related to unintentional injuries (90.7 percent of all injury and poisoning visits) with a reported total charge of \$45,522,507, or 91.9 percent of the total cost of all injury and poisoning charges. Fifty percent of all injury related visits were caused by falls, motor vehicle traffic crashes, and striking against or struck accidentally by object or persons. Unintentional falls accounted for the largest percent of all injury and poisoning related visits (23.2 percent) which is slightly higher than the national rate of 20.6 percent (NHAMCS, 1996). The average charge for unintentional falls was reported at \$267 per visit. Other frequently reported external causes of unintentional injuries were motor vehicle traffic crashes (11.5 percent), striking against or struck accidentally by object or persons (15.3 percent), and accidents caused by cutting or piercing instruments or objects (10.1 percent). The associated average charges for each of these unintentional injury categories were reported at \$330, \$203, and \$174 respectively. Intentional injuries have accounted for only 3.9 percent of all injury and poisoning related visits with a reported total charge of \$2,816,200 (see Table 7)

Principal Diagnosis - Table 8 presents data on some of the significant principal diagnosis groupings, using the major disease categories specified by ICD-9-CM, for Utah during 1996. Consistent with national trends, open wounds (excluding head) and contusions led the list in terms of number of visits (31,074, or 7 percent and 26,785, or 5 percent) in Utah and (5 and 5 percent) nationally (NHAMCS, 1996); heart diseases (excluding ischemic) and chest pain led the list in terms of average cost per visit (\$674 and \$510). As displayed in Table 8, open wounds and contusions as primary reasons for visits, are followed by open wounds of head and abdominal pain (24,285, or 5 percent and 19,411, or 4 percent). Cost wise, heart diseases and chest pain

are followed by convulsions and diabetes, with an average cost of \$390 and \$377. Visits for non-life-threatening and common illnesses, such as 11,094 visits for ear infections and 16,086 visits for sore throats with the corresponding reported total charges of \$1,025,428 and \$2,559,545, might have been better treated in a clinic or doctor's office at a much lower cost.

Primary Payers – Public insurance (Medicare, Medicaid, and other government sources) was the primary source of payment for more than 23 percent of ED visits (see Table 5). Within public insurance agencies, Medicaid and Medicare, with 10.6 and 9.6 percent, had almost an equal share as primary payers followed by other government sources (3.2 percent). Managed care organizations with 19.5 percent were reported as the number one source of primary payment. Next to public insurance agencies and managed care organizations as primary payers, were self pay (7.6 percent), Blue Cross Blue Shield (7.2 percent), and industrial (5.8 percent).

Organization of this Report

There are eight types of tables in this report and the description of each table is included below. The groupings for the tables in this report are derived from the principal diagnosis or patient demographics that were coded by the hospital in the patient record. Each patient ED billing record contains patient demographic, clinical coding classifications based on the International Classification of Diseases, 9th Revision Clinical Modification (ICD9-CM), payer, and utilization data for each visit.

Categories shown in this report were based on ICD9-CM coding ranges defined in the National Hospital Ambulatory Medical Care Survey: 1996 Emergency Department Summary developed by the National Center for Health Statistics.

This report presents the distribution, composition, and outcome measures of ED visits by selected characteristics. The information is shown by hospital and arranged in the sequence listed above according to peer groups. Where appropriate, comparative statistics are shown for the hospital's peer group by state. The

descriptions of the tables are as follows:

- Table 1 Presents the State level volume of ED encounters and total ED charges by hospital's geographic regions.
- Table 2 Presents the State level volume of ED visits, average, and total ED charges by Major Disease Category (MDC) and ICD-9 code range.
- Table 3 Presents the State level volume, average, and total ED charges by the general categories of Intent of injury.
- Table 4 Presents the State level volume, average and total ED charges by Principal Diagnosis Group and ICD-9 Codes for selected categories.
- Table 5 Presents the hospital level patient profile: gender, age, type of admission, discharge status, primary payer category.
- Table 6 Presents the hospital level volume of ED visits and total ED charges by Major Disease Category (MDC) and ICD-9 code range.
- Table 7

 Presents the hospital level volume of ED visits, average, and total ED charges by intent and mechanism of injury categories (E-codes or External Causes of Injury codes) as listed in the ICD-9-CM and type of injury categories (ICD-9-CM code range 800-989). It is grouped to highlight the interaction between intentionality of the injury and the mechanism that produced the injury.

Table - 8 Presents the hospital level volume and average ED charges by Principal Diagnosis Grouping and ICD-9 Codes for selected categories.

Description of Table Entries

Using health care data to impact decision making requires a commitment on the part of and type of user to understand the complex nature of health care. Decision making is not simple and cannot be reduced to a single indicator. The entries in the following tables will assist the users in interpreting the information.

<u>Encounters</u> - Number of ED encounters that occurred from January 1, 1996 to December 31, 1996. These include patients with out of state residencies.

<u>Total Charges</u> - Sum of all ED facility charges included in the billing form, excluding professional fees. This is different from <u>cost</u> of treatment or payment received by the hospital.

Average Charges - Sum of total charges divided by number of releases. The average lends itself to further mathematical manipulation for example, by multiplying it with a projected number of releases to predict future resource use. Thus it was chosen over other measures, such as the median or mode, neither of which has this statistical property.

<u>Major Disease Categories</u> - Mutually exclusive principal diagnosis categories. The diagnoses in each MDC correspond to a single organ system or etiology and in general, are associated with a particular medical specialty.

Outlier - See "Outlier Cases" below.

Gender - Self-explanatory

Age - Derived from dates of birth and visit.

Limitations

This report shows total billed ED charges. Billed charges are to be used as one indicator of hospitals' ED performances. All patients, or insurance plans, do not pay the same amount for similar treatments, supplies, services, and procedures, even though they may be billed the same amount. Hospitals offer a variety of contracts, many with discount arrangements based on volume.

This report can be used to compare broad measures of ED utilization for all hospitals, but more detailed data are needed to look at specific performance comparisons between hospitals. The report addresses ED utilization issues, but does not directly measure the quality of medical care. This information serves as an important step toward targeting prevention programs and educating Utahns about their health.

USING THE REPORT

Sources of Hospital Variation in Volume and Outcome of ED Encounters

Users of this report must remember that several factors such as volume of patients encountered, coding inconsistencies, and severity of patient illness can influence comparisons between hospitals. When interpreting the information shown in this report, the reader is advised to keep in mind the following:

Volume

If a hospital released only a few types of certain cases, comparing data with other hospitals would not be especially meaningful because a small number of cases are not sufficient to establish a pattern of treatment. The reader must exercise caution when interpreting measures shown in this report that were based on less than five releases.

Coding

The intra-hospital data variations may be a reflection of the differences in coding practices and quality of data.

The ED Submission Manual provides data element definitions and standards to ensure that all hospitals will report similar data. Additionally, each hospital is provided with a 35-day review period to validate the committee's data against their hospital records.

Despite the validation process, data quality is still a concern, but it is expected to improve over time as hospitals become accustomed to reporting data for public dissemination. Any comparative analysis or decision making, based on this data, should take into account issues of data quality.

Severity of Illness

Patients visiting EDs for the same treatment and conditions often vary in the severity of illness. Factors such as age, gender, and secondary illnesses account for differences in severity. Treating severely-ill patients is the most resource intensive and expensive for any hospital. For instance, patients who are severely ill may need to be admitted to intensive care units; require high-technology equipment; or may need to stay longer in hospitals than patients that are less ill.

Some hospitals, especially regional referral centers such as Primary Children's Medical Center and LDS Hospital, treat more acutely ill patients because of the specialized care available at their facility. The University of Utah hospital, which serves as a regional referral center as well as a major teaching hospital, treats more patients with complex medical conditions than other hospitals. Because of services offered and the condition of patients served, charges for patient care at these hospitals may be higher than at other hospitals

Rural hospitals often admit a mix of patients that may be chronically ill, uninsured, or elderly. The elderly are often more severely ill because of chronic and multiple health problems than their counterparts.

[The remaining sections are derived from comparative performance of U.S. Hospitals: <u>The Source book</u>, 1992, Health Care Investment Analysts, Inc. (HCIA).]

Size

Larger hospitals typically provide a more extensive array of services that are more sophisticated and resource-intensive than small, rural hospitals, such as specialized intensive care units. In addition to the standby costs of maintaining a broader scope of services, larger hospitals generally treat more complex and severely ill patients. That is, the services that large hospitals produce are different in nature from those produced by small ones.

Furthermore, larger hospitals are typically located in urban areas, which tends to increase costs. Finally, larger hospitals more frequently engage in the provision of graduate medical education and research which results in additional direct and indirect costs not incurred by smaller, non-teaching hospitals.

However, larger hospitals do enjoy several advantages over smaller hospitals. They are better able to attract patients and physicians than smaller hospitals, and the quality of care they provide is perceived as higher. Also, the more ill patients, for whom they care for, are less able to postpone care. That is, a smaller proportion of their patients are elective admissions.

Location

Urban hospitals, compared with rural ones, have higher costs and revenues for a variety of reasons. Cost of labor is among the most important reasons of why urban hospitals incur higher costs when compared with rural hospitals. Hospitals in urban labor markets must typically pay more to employ nurses, administrators, hospital-based physicians, and nearly all other hospital personnel. Primarily because urban hospitals tend to be larger and are faced with greater competition, they generally offer a broader scope of more sophisticated services than do rural hospitals. As a result, urban hospitals generally treat patients requiring more complex care. This further increases their costs when compared with rural hospitals. The inner-city urban hospitals tend to treat a patient mix that is disproportionately poor or elderly compared with suburban hospitals, which tends to increase their costs.

Teaching Status

Teaching hospitals are those that provide medical education, primarily graduate medical education. The most prominent differences between teaching and non-teaching hospitals occur as a result of the contemporaneous provision of teaching and patient care. Teaching hospitals incur certain costs directly associated with medical education programs, the largest category being the salary and benefits expense for interns and residents. Furthermore, the process of educating interns, residents, and other medical trainees normally results in longer lengths of stay and the use of more ancillary services.

The second major difference between teaching and non-teaching facilities is the broader and more complex scope of services offered by teaching hospitals. Because of the sophisticated service offerings and types of physicians who practice in teaching hospitals, they attract more severely ill patients, who frequently have more complicated diagnoses or are in need of more complex procedures and care.

Strategies to Improve Comparability

All-Patient Refined (APR) DRG

The APR-DRGs are a patient classification scheme developed by 3M Health Information Systems (HIS) that follows the basic DRG methodology of classifying patients into disease categories, but further subdivides each disease category into

severity of illness classifications. With a few exceptions, a patient in each disease category (called consolidated DRG) is assigned into one of four levels of severity: no/minor complication or comorbidity (CC), moderate CC, major CC and extreme CC. Some exceptions to the four-level classification are newborns and neonates that are assigned to APR-DRGs formed with the severity of condition already built-in (e.g., APR-DRG 606: Neonate, birth weight 1000-1499g with significant O.R. procedure, released alive.)

APR-DRG categories were used to define charge outliers and calculate the Case Mix Index (See Case Mix Index).

Outlier Cases

Some patients have exceptionally low or high total facility charges. A hospital's charges can be affected by just a few unusually expensive (or inexpensive) cases. These high or low values could be a result of coding or data submittal errors, particularly in total charges, or data elements that effect DRG assignments. Other reasons for exceptionally low charges could be due to death or transfer to another facility. Exceptionally high charges could be due to a catastrophic condition. Whatever the reason, these values, referred to as "outliers," distort the averages and were excluded from calculations. The high total facility charge outliers are defined in this and succeeding reports as values above 2.5 standard deviations from the mean. Means and standard deviations are APR-DRG specific and calculated on a statewide basis. The low outliers were defined as a non-newborn or non normal delivery encounter with less than \$300 charge. However, the calculations in this report do not exclude low outliers. A preliminary analysis showed that of the encounters meeting this definition, a high proportion are in the DRG "Other factors influencing health status," for which it was difficult to determine whether they were true outliers.

Case-Mix Index

An important source of variation among hospitals in a summary measure of outcome -such as length of stay, total charges, and severity of illness - is the differences in the complexity of the patients they treat. To allow for a meaningful comparison of outcome measures between hospitals, an adjustment factor based on patient complexity should be applied. Therefore, four case-mix

indices (all-patient, acute, obstetric, and pediatric) have been calculated for each hospital and are shown on the tables in this report. A hospital's case-mix index of 1.15 means that the overall case mix of a hospital requires 15 percent greater intensity of resource use relative to the state as a whole. See Appendix A for a description of the calculation of the case-mix indices.

Hospital Peer Groups

Comparing summary outcome measures (length of stay, total charges, readmission rates, mortality rates) among hospitals has always been controversial because of the difficulty of defining what makes hospitals "comparable." As discussed previously, summary outcome measures vary among hospitals depending on various factors such as location, bed size, ownership, affiliation, and teaching status. If all these factors were to be considered in defining peer groups, each hospital might end up in a group by itself.

The question is, "Why define peer groups at all?" The answer is that given hospital-level data, users tend to compare hospitals. Without peer groupings to reference, readers would compare a hospital with either the state level data or another arbitrarily chosen hospital.

It was determined that this report would contain summary statistics for a hospital's peer group as well as for the hospital and the state. The next issue was the basis for the grouping, which is discussed below.

Among various factors which affect a hospital's average charges, location and case mix indicators play important roles in determining the complexity of patients treated in the hospital. Therefore, the bases for the 1993 hospital grouping are location (urban/rural) and the all-patient case-mix index, except for psychiatric and substance abuse hospitals and non-comparable hospitals.

The hospitals are assigned to peer groups according to 1996 UHDDB all patient case-mix index (CMI). The 1996 UHDDB all patient CMI is shown below.

Group 1: Acute Care, Urban, High CMI

Group 2: Acute Care, Urban, Upper Medium CMI

St. Mark's Hospital	1.1155
McKay-Dee Hospital Center	1.0659
Salt Lake Regional Medical Center	0.9747
Utah Valley Medical Center	1.0635

ADDITIONAL ED DATA RESOURCES

ED-AR1 Tables in Electronic Form

The tables included in this report can be made available in electronic form upon request. Patient-level data are also available in electronic form (See Appendix).

Future Reports

The ED-AR1 report contains a wealth of data and will serve as the basis for several consumer-friendly reports. Standard documents will be published and distributed to a wide range of audiences.

Electronic Data

BEMS supports legitimate access to its emergency department data base while protecting the patient, and hospital right of privacy.

<u>Public Data Sets (PDS)</u> are available with minimal controls. Different data files are designed to provide general health care data to a wide spectrum of users.

<u>User Defined Data Set (UDDS)</u> is available through the "Request for Data Release" process. Researchers may request, in writing, a research oriented database for bona fide research and statistical purposes. BEMS will forward these requests to the Department of Health Institutional Review Board for review and approval.

<u>Special Data requests</u> will be reviewed jointly by OHDA and BEMS.

For information or data request, contact:

Bureau of Emergency Medical Services Utah Department of Health 288 North 1460 West PO Box 142004 Salt Lake City, UT 84114-2004 (801) 538-6011

APPENDIX A

Case-Mix Index

The case-mix indices were derived as follows:

1. Calculate relative weight for each APR-DRG i:

$$W_i = \frac{C_i}{C_s}$$

where:

i = APR-DRG i

s =State Level

 W_i = Relative weight for APR-DRG i

 C_i = Average charge for APR-DRG i

 C_s = Average charge for all patients

2. Calculate case-mix index for hospital *j*:

$$I_{j} = \frac{\sum_{i=1}^{1315} W_{i} N_{ij}}{N_{i}}$$

where:

j = Hospital j

I = Case-Mix index for hospital i

 N_{ii} = Number of discharges for

APR-DRG i and hospital j

 N_i = Total discharges for hospital j

In the calculation of all the case-mix indices, the following were excluded: higher outliers and discharges from psychiatric and substance abuse hospitals, South Davis Community Hospital, Bonneville Health and Rehabilitation, HEALTHSOUTH Rehabilitation Hospital of Utah, Veterans Hospital, and Utah State Hospital. Besides the above exclusions, the discharges included in each of the case-mix indices are described below:

All-Patient Case-Mix Index: All discharges

<u>Acute Case-Mix Index</u>: All discharges but excluding newborns (ICD-9:V30-V39).

Obstetric Case-Mix Index: Discharges assigned Major Diagnosis Category (MDC) 14 (Pregnancy, Childbirth, & the Puerperium)

<u>Pediatric Case-Mix Index</u>: Patients aged 0-17, excluding newborns.

APPENDIX B

Electronic Resource Documents

Public Data Sets (PDS) are available with minimal controls. Different data files are designed to provide general health care data to a wide spectrum of users. Although the data is at the patient level, considerable care has been taken to ensure that no individual patient could be identified from the data. The data elements included in the public use data files are listed below.

- 1 Provider Identifier (Hospital)
- 2 Patient's age (in 5-yr. group)
- 3 Patient's gender
- 4 Source of admission
- 5 Total hours stay
- 6 Patient's release status
- 7 Patient's postal zip code
- 8 Patient's residential county
- 9 Patient 's migrant status
- 10 Patient's marital status
- 11 Patient's race
- 12 Patient's ethnicity
- 13 Principal diagnosis
- 14 Secondary diagnosis 1
- 15 Secondary diagnosis 2
- 16 Secondary diagnosis 3
- 17 Secondary diagnosis 4
- 18 Principal procedure
- 19 Secondary procedure 1
- 20 Secondary procedure 2
- 21 E CODE
- 22 Admission Hour
- 23 Total charge
- 24 ED Charge
- 25 Primary payer category
- 26 Secondary payer category
- 27 Tertiary payer category
- 28 Patient's relationship to insured
- 29 Charge Outlier
- 30 Length of Stay Outlier
- 31 Release Quarter
- 32 Secondary diagnosis code 5
- 33 Secondary diagnosis code 6
- 34 Secondary diagnosis code 7

- 35 Secondary diagnosis code 8
- 36 Secondary procedure code 3
- 37 Secondary procedure code 4
- 38 Secondary procedure code 5

User Defined Data Set (UDDS) is available through the "Request for Data Release" process. BEMS supports legitimate access to its ED data base while protecting the patient and hospital right of privacy. To ensure the patient privacy, all requests for data release not in aggregated form shall be submitted in letter form to the BEMS director, specifically stating the purposes for which the data is requested. Researchers may request, in writing, a research-oriented database for bona fide research and statistical purposes. BEMS will forward these requests to the Department of Health Institutional Review Board for review and approval.

Please send requests for data to:

Bureau of Emergency Medical Services Utah Department of Health 288 North 1460 West PO Box 142004 Salt Lake City, UT 84114-2004 (801) 538-6011

Special Data requests will be reviewed jointly by OHDA and BEMS.
